Note the missing "r"

In this example, the cybercriminal has newly purchased a domain with one letter different -- missing the "r" -- to effectively hijack the reply and continue corresponding, posing as a long-time contact.

After an email is deemed important enough to send in a special RMail way, RMail presents the full email address of each recipient to make it easy for senders to re-verify that they are about to send **the right message to the right recipient**. And, if RMail identifies any cybercriminal trickery in the email addresses, such as clever domain misspells or tricky message header reply-to pivots, it instantly alerts the sender.
